

Charlene Huynh - Project Portfolio

Project 1: ERP Architecture & Business Process Mapping (Odoo)

Skills: Odoo ERP | Business Process Mapping | Workflow Integration

The challenge: A telecom business of (50 people) relied on fragmented software and manual processes. Data was scattered and there is limited visibility between sales, installation and accounting.

The solution: I designed and implemented a centralized Odoo ERP structure, I map end-to-end workflow connecting CRM, Sales, Project Management and Accounting.

Result: Everything is in one place. The company automates 150+ monthly invoices, reduces manual data entry, and has clearer visibility across departments.

Project 2: AI Reporting Automation (Microsoft Power Automate)

Skill: Microsoft Power Automate | Jira Integration | AI/LLM prompts | Workflow Optimization

The challenge:

To prepare for our weekly progress report, I spent 2+ hours going through daily stand-up logs, Jira tickets and chasing developers to translate technical updates into business-ready reports.

The solution:

Every Friday morning, Power Automate automatically gathers the past week's completed Jira tickets (through Jira connector) and daily stand-up logs, feeding them directly into an AI engine. Using a custom prompt, I designed to translate complex engineering jargon into clear business language, the system instantly generates a polished weekly summary (including blockers and next steps) and emails it straight to my inbox.

Result: We turned a four-hour headache into a zero-minute process. The developers can stay focused on their code, and our stakeholders get a high-quality update.

Project Milestones & Progress

- ✓ Backend API integration for the Odoo CRM module has been finalized, with successful unit testing completed, marking 75% overall progress in this area.
- ✓ High-fidelity UI layout design is complete, and the local development environment is fully set up, providing a solid foundation for further front-end development.
- ✓ Legacy telecom customer database migration to the new Odoo staging environment is 60% complete, with ongoing data validation to ensure accuracy and integrity.

Operational Blockers

- ⚠ Implementation of the interactive "Submit" button functionality for the user dashboard is currently blocked, impacting front-end feature delivery.
- ⚠ Data validation post-database migration is at risk of delay, which may affect the overall timeline for the customer data integration phase.

Management Action Plan

- 👉 Collaborate with the front-end team to identify and resolve the blocker on the "Submit" button functionality, ensuring timely progress.
- 👉 Allocate additional resources or support to accelerate data validation efforts and mitigate risks associated with the migration phase.
- 👉 Continue monitoring backend integration and automated data sync tasks to maintain momentum and meet upcoming milestones.
- 👉 Acknowledge the team's diligent efforts in advancing critical components of Project A and encourage ongoing communication to address challenges.

Project 3: Prototyping for Stakeholder Alignment

Interactive prototype link: [Figma](#)

Skill: Figma | User Flow Mapping | Requirement Visualization

Challenge: Technical discussions alone can lead to misalignment, as stakeholders and developers may interpret requirements differently.

The Solution: To prevent this, I use Figma to create quick prototypes. Before a single line of code is written, I build a visual, interactive version of the app so stakeholders can "click through" the experience and give their feedback early.

Result: This helps align teams upfront, encourages constructive feedback, and minimizes costly adjustments later in the project.
